

Carbon Monoxide Poisoning

1 Take your cat away from the source and into fresh air

2 Help to provide a patent airway by extending and aligning the head and neck. Gently pull the tongue slightly forward.

3 If available, give oxygen by face mask.

4 If your pet is non-responsive and has stopped breathing, be prepared to give artificial respiration by closing your cat's mouth with one hand and gently breathe into your cat's nostrils.

5 Administer 10-20 breaths per minute for small cats. With each breath, one should see the chest slightly rise.

6 Keep breathing for your cat until he/she is able to breathe on its own.

7 Transport your cat to the nearest vet for oxygen therapy and supportive treatment.

DO NOT breathe in the air that your pet exhales

DO NOT leave cars running in the garage with the garage door closed or even slightly closed. The garage door should be completely open to prevent toxic levels of carbon monoxide from building up
