

## Flea Allergy

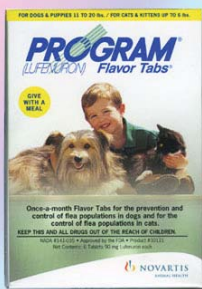

**1**

Treat your cat for fleas with a vet approved topical product for flea control even if you don't see any fleas.

**2**

For severe flea infestations, ask your vet about an oral pill for fast initial knock down of fleas.

**3**

Treat all animals in contact for fleas as fleas can spread rapidly between pets.

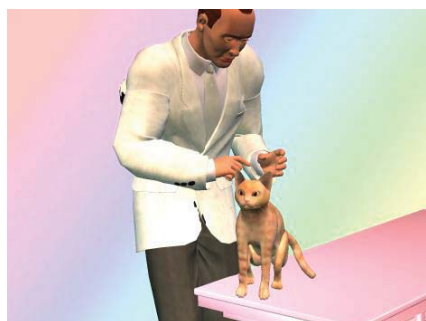

**4**

Treat the environment for flea infestations (e.g. bedding, floors, furniture, yards, etc.)

**5**

If your cat shows signs of discomfort and continues to scratch and groom excessively despite treatment and you notice skin lesions, seek veterinary attention for further treatment as your cat may have a secondary skin infection or another type of allergy.

Wash all pet bedding in hot soapy water.

Exterminate the home using a product that kills fleas at all life stages.

Block off pet access to dark and damp areas such as under the house or in sheds

To avoid fleas in the environment vacuum the entire house especially furniture, baseboard cracks, and cat's sleeping area and then throw out the vacuum bag

Place your cat's bedding into the wash each week to rid of any fleas as the soap and hot water will kill them

A once a month treatment like Frontline is a great preventive

Clear away all damp and moist areas such as plant & leaf debris

The key to flea control is treating all pets and the environment they live in
